

Product Strategy: eat-resume

I. Core Success Metrics (KPIs)

To evaluate whether the tool is successfully fulfilling the core Jobs-to-be-Done (JTBD) for HR professionals, we will track four primary metrics across efficiency, quality, and adoption:

- **Time Savings per Hire (Efficiency):** The total hours saved per requisition. Calculated by comparing the AI's processing time (currently ~15 seconds per batch) against the historical baseline of manual human screening (average 3 minutes per resume).
 - **Human-AI Agreement Rate (Quality):** The percentage of AI-generated "Interview" or "Reject" recommendations that are accepted by the human hiring manager without modification before sending the final email draft.
 - **Pipeline Success Rate (Technical):** The percentage of resumes successfully processed end-to-end without triggering API rate limits or unsupported format errors. (Target: > 98%).
 - **Hiring Manager Retention (Adoption):** The percentage of recruiters or hiring managers who return to use the pipeline for their second and third job postings, indicating sustained workflow value over initial novelty.
-

II. Product Roadmap

Phase 1: MVP (Current)

Goal: Prove core technical viability and eliminate manual top-of-funnel reading.

- **Ingestion:** Single and multi-file PDF extraction via frontend webhook.
- **Intelligence:** Dual-agent AI architecture (Candidate Info Extractor + Rubric Analyzer) powered by Google Gemini.
- **Infrastructure:** Automated routing based on strict categorical status (Interview, Hold, Reject) with database logging in Google Sheets.
- **Action:** Automated personalized email drafting in Gmail.

Phase 2: Near-Term Enhancements (Months 1–3)

Goal: Improve user experience, system resilience, and expand input flexibility.

- **Multi-Format Parsing:** Integrate robust extraction nodes to support `.docx` and `.txt` files alongside PDFs.

- **Dynamic Rubric Generation:** Allow hiring managers to weight specific skills (e.g., emphasize "B2B SaaS" over "Agile") within the frontend UI before clicking Analyze.
- **Rate-Limit Handling:** Implement sophisticated queueing and auto-retry mechanics to process massive batches (100+ resumes) without API throttling.

Phase 3: Enterprise Integration (Months 4–6+)

Goal: Embed seamlessly into existing enterprise HR tech stacks.

- **ATS Integration:** Replace Google Sheets with direct API integrations to major Applicant Tracking Systems (e.g., Greenhouse, Lever) to update candidate profiles automatically.
- **Automated Scheduling:** Integrate with calendar tools (e.g., Calendly) to automatically embed interview booking links into the "Interview" email drafts.
- **Bias Mitigation Dashboard:** Introduce an analytics view to audit AI scoring patterns over time, ensuring fair evaluation across diverse applicant pools.
